- 5 Numerical illustrations
- 6 Conclusions

• The observations: independent copies of

 $(U, X, Z) \in \mathcal{H}_1 \times \mathcal{H}_2 \times \mathbb{R}^k$

Typically

$$\begin{array}{c} \bullet \\ \mathbf{\mathcal{H}}_1 = \mathbb{R} \text{ and } \mathcal{H}_2 = L^2[0,1] \\ \bullet \\ \mathbf{\mathcal{H}}_2 = L^2[0,1] \\ \mathbf{\mathcal{H$$

2 or $\mathcal{H}_1 = \mathcal{H}_2 = L^2[0, 1]$

3

< ロ > < 同 > < 回 > < 回 >

• The observations: independent copies of

$$(U, X, Z) \in \mathcal{H}_1 \times \mathcal{H}_2 \times \mathbb{R}^k$$

Typically

1 $\mathcal{H}_1 = \mathbb{R}$ and $\mathcal{H}_2 = L^2[0, 1]$ or $\mathcal{H}_1 = \mathcal{H}_2 = L^2[0, 1]$

• The variable U could be observed or *estimated* from some model

- 3 **>** - 3 3

• The observations: independent copies of

$$(U, X, Z) \in \mathcal{H}_1 \times \mathcal{H}_2 \times \mathbb{R}^k$$

Typically

- 1 $\mathcal{H}_1 = \mathbb{R}$ and $\mathcal{H}_2 = L^2[0, 1]$ 2 or $\mathcal{H}_1 = \mathcal{H}_2 = L^2[0, 1]$
- The variable U could be observed or *estimated* from some model
- The problem: test

$$H_0$$
: $\mathbb{E}(U \mid X, Z) = 0$ a.s.

against the nonparametric alternative

$$H_1: \quad \mathbb{P}[\mathbb{E}(U \mid X, Z) = 0] < 1$$

Examples: testing the non-effect

- Independent samples of U, X and Z are observed
 - Scalar response U (functional covariate X, vector covariate Z)
 - Functional response U (functional covariate X, vector covariate Z)

A (10) > A (10) > A (10)

Testing parametric functional regression models (1/2)

The framework

Functional quadratic regression

• samples of $Y \in \mathbb{R}$ and $X \in L^2[0, 1]$ are observed

Introduction

• For some unknown $c \in \mathbb{R}$ and $b_1 \in L^2[0,1], b_2 \in L^2([0,1] \times [0,1])$

$$Y = c + \int_0^1 b_1(t)X(t)dt + \int_0^1 \int_0^1 b_2(t,s)X(t)X(s)dtds + U$$

The functional quadratic model is correct iff

$$\mathbb{E}(U \mid X) = 0 \quad a.s.$$

Introduction The framework

Testing parametric functional regression models (2/2)

Functional generalized linear models

• samples of $Y \in \mathbb{R}, X \in L^2[0, 1]$ and $Z \in \mathbb{R}^k$ are observed

• For some given $g(\cdot)$ and unknown $c \in \mathbb{R}$, $\gamma \in \mathbb{R}^k$ and $b \in L^2[0, 1]$

$$Y = g(c_0 + Z'\gamma + \langle b, X \rangle) + U$$

where

$$\langle b,X\rangle = \int_0^1 b(t)X(t)dt.$$

- Examples: g(u) = u, $g(u) = \exp(u)[1 + \exp(u)]^{-1}$,...
- The parametric model with functional covariates is correct iff

$$\mathbb{E}(U \mid X, Z) = 0$$
 a.s.

Testing semiparametric functional regressions

Semi-functional partial linear functional regression model

- samples of $Y \in \mathbb{R}$, $Z \in \mathbb{R}^k$ and $X \in L^2[0, 1]$ are observed
- For some unknown $c \in \mathbb{R}, \gamma \in \mathbb{R}^k$ and $m(\cdot)$

$$Y = c + Z'\gamma + m(X) + U$$

- Before estimating the function *m*(·), one should check the effect of the functional covariate
- Testing the significance of the functional covariate:

$$\mathbb{E}(Y-c-Z'\gamma\mid X,Z)=0 \quad a.s.$$

- **→ →** •

Lemma (Fundamental Lemma cont'd)

(B) Under some mild additional conditions if

$$\mathbb{P}[\mathbb{E}(U \mid X, Z) = 0] < 1,$$

then there exists a positive integer $p_0 \ge 1$ such that for any integer $p > p_0$, the set

$$\{\gamma \in \mathcal{S}^{p} : \mathbb{E}(U \mid \langle X, \gamma \rangle, Z) = 0 \ a.s. \}$$

has Lebesgue measure zero on the unit hypersphere S^p .

A (10) A (10) A (10)

Corollary

Let

- U such that $\mathbb{E}|U| < \infty$
- For any p ≥ 1, γ ∈ ℝ^p, let w_{p,γ}(t, z), t ∈ ℝ and z ∈ ℝ^k, be a real-valued function such that w_{p,γ}(⟨X, γ⟩, Z) > 0 for all ||γ|| = 1.

The following statements are equivalent:

- The null hypothesis H_0 : $\mathbb{E}(U \mid X, Z) = 0$ a.s. holds true.
- I and any set B_p ⊂ S^p with strictly positive Lebesgue measure in on the unit hypersphere S^p,

$$\max_{\gamma \in B_{\rho}} \mathbb{E}\left[U\mathbb{E}\left(U | \langle X, \gamma \rangle, Z \right) w_{\rho,\gamma}(\langle X, \gamma \rangle, Z) \right] = 0.$$

- 6 Conclusions

• For any $\gamma \in \mathcal{S}^{p}$, let

$$Q_n(\gamma) = \frac{1}{n(n-1)h^{k+1}} \sum_{1 \le i \ne j \le n} U_i U_j K\left(\langle X_i - X_j, \gamma \rangle / h\right) \widetilde{K}\left((Z_i - Z_j) / h\right),$$

where $K(\cdot)$ is a univariate kernel, $\widetilde{K}(\cdot)$ is a multivariate kernel and *h* a bandwidth.

• $Q_n(\gamma)$ is a sample based approximation of

$$Q(\gamma) = \mathbb{E}\{\mathbb{E}^2[U \mid \langle X, \gamma \rangle, Z] f_{\gamma}(\langle X, \gamma \rangle, Z)\}$$

• The least favorable direction γ for H_0 is defined as

$$\widehat{\gamma}_{n} = \arg \max_{\gamma \in B_{p}} \left[n h^{(k+1)/2} Q_{n}(\gamma) / \widehat{\nu}_{n}(\gamma) - \alpha_{n} \mathbb{I}_{\left\{ \gamma \neq \gamma_{0}^{(p)} \right\}} \right] , \quad (3)$$

where

- $\hat{v}_n^2(\cdot)$ be as estimate of the variance of $nh^{1/2}Q_n(\cdot)$
- γ₀^(p) is an initial guess and B_p ⊂ S^p with strictly positive Lebesgue measure in S^p that contains γ₀^(p)
- α_n ↑ ∞, n ≥ 1 is a sequence that depends on the sample size and the rates of h and p

A D A D A D A

The test statistic

Consider

$$T_n = nh^{(k+1)/2} rac{Q_n(\widehat{\gamma}_n)}{\widehat{v}_n(\widehat{\gamma}_n)}$$

- An asymptotic α-level test is given by I (T_n ≥ z_{1-a}), where z_a is the (1 − a)-th quantile of the standard normal distribution
- The variance could be estimated by

$$\widehat{v}_{n}^{2}(\gamma) = \frac{2}{n(n-1)h^{k+1}} \sum_{j \neq i} U_{i}^{2} U_{j}^{2} \mathcal{K}^{2}\left(\langle X_{i} - X_{j}, \gamma \rangle / h\right) \widetilde{\mathcal{K}}^{2}\left((Z_{i} - Z_{j}) / h\right)$$

一日

Technical conditions (1/2)

(a) The random vectors $(U_1, X_1, Z_1), \ldots, (U_n, X_n, Z_n)$ are independent draws from the random vector $(U, X, Z) \in \mathbb{R} \times L^2[0, 1] \times \mathbb{R}^k$ that satisfies $\mathbb{E}|U|^m < \infty$ for some m > 11.

(b) $\exists \underline{\sigma}^2$ and $\overline{\sigma}^2$ such that $0 < \underline{\sigma}^2 \leq Var(U \mid X, Z) \leq \overline{\sigma}^2 < \infty$ a.s.

- (c) The sets $B_p \subset S^p$, $p \ge 1$ are such that:
 - (i) ∀γ ∈ B_p, ⟨X, γ⟩ and Z admit a joint density f_γ(·, ·) that satisfies some mild technical conditions;
 - (ii) the initial 'guesses' $\gamma_0^{(p)} \in B_p$ satisfies the condition: $\exists C$ such that $f_{\gamma_0^{(p)}} \leq C, \forall p \geq 1.$

(iii)
$$B_{\rho} \times 0_{\rho'-\rho} \subset B_{\rho'}, \forall 1 \leq \rho < \rho'.$$

A (10) A (10)

(a) The kernels K and \widetilde{K} satisfy some mild conditions

(b) $h \to 0$ and $nh^{2(k+1)} / \ln^{\alpha} n \to \infty$ for some $\alpha > 1$.

(c) $p \ge 1$ depends on n: $\exists \lambda > 0$ such that $p \ln^{-\lambda} n$ is bounded.

Behavior under the null

The steps of the theory under the null hypothesis (3/3)

Theorem

If H_0 holds true, the test statistic T_n converges in law to a standard normal.

Apply the CLT for the U-statistic

$$Q_n\left(\gamma_0^{(p)}\right) = \frac{1}{n(n-1)h^{k+1}} \sum_{1 \le i \ne j \le n} U_i U_j K\left(\langle X_i - X_j, \gamma_0^{(p)} \rangle / h\right) \widetilde{K}\left((Z_i - Z_j) / h\right)$$

A .

Behavior under the null

The steps of the theory under the null hypothesis (3/3)

Theorem

If H_0 holds true, the test statistic T_n converges in law to a standard normal.

Apply the CLT for the *U*-statistic

$$Q_n\left(\gamma_0^{(p)}\right) = \frac{1}{n(n-1)h^{k+1}} \sum_{1 \le i \ne j \le n} U_i U_j K\left(\langle X_i - X_j, \gamma_0^{(p)} \rangle / h\right) \widetilde{K}\left((Z_i - Z_j) / h\right)$$

Control the spectral norm (2-norm) and the Frobenius norm of the zero-diagonal matrix with generic element

$$\frac{1}{n(n-1)h^{k+1}} \mathcal{K}\left(\langle X_i - X_j, \gamma_0^{(p)} \rangle / h\right) \widetilde{\mathcal{K}}\left((Z_i - Z_j) / h\right), \qquad i \neq j$$

The Omnibus test property

$$T_{n} = \frac{nh^{(k+1)/2}Q_{n}(\widehat{\gamma}_{n})}{\widehat{v}_{n}(\widehat{\gamma}_{n})}$$

$$= \max_{\gamma \in B_{p}} \left\{ nh^{(k+1)/2}Q_{n}(\gamma)/\widehat{v}_{n}(\gamma) - \alpha_{n}\mathbb{I}_{\{\gamma \neq \gamma_{0}^{(p)}\}} \right\} + \alpha_{n}\mathbb{I}_{\{\widehat{\gamma}_{n} \neq \gamma_{0}^{(p)}\}}$$

$$\geq \max_{\gamma \in B_{p}} \frac{nh^{(k+1)/2}Q_{n}(\gamma)}{\widehat{v}_{n}(\gamma)} - \alpha_{n} \geq \frac{nh^{(k+1)/2}Q_{n}(\widetilde{\gamma})}{\widehat{v}_{n}(\widetilde{\gamma})} - \alpha_{n}, \quad \forall \widetilde{\gamma} \in B_{p} \subset S^{k}$$

크

< 回 ト < 三 ト < 三

- Let some real-valued function $\delta(X, Z)$ such that $\mathbb{E}[\delta(X, Z)] = 0$ and $0 < \mathbb{E}[\delta^4(X, Z)] < \infty$, and some sequence of real numbers r_n that could decrease to zero (the case $r_n \equiv 1$ is also included).
- Consider the sequence of alternatives

$$H_{1n}: U = U^0 + r_n \delta(X, Z), \quad n \ge 1, \text{ with } \mathbb{E}(U^0 \mid X, Z) = 0.$$

- We show that such directional alternatives can be detected as soon as $r_n^2 nh^{(k+1)/2}/\alpha_n$ tends to infinity.
- However, in the functional data framework, to obtain the convenient standard normal critical values, we need $1/\alpha_n = o(p^{-3/2} \ln^{-1} n)$.
- Hence, the rate r_n at which the alternatives H_{1n} tend to the null hypothesis should satisfy $r_n^2 n h^{(k+1)/2} / \{p^{3/2} \ln n\} \to \infty$.

一日

- Simplify and consider the case with no covariate Z
- The model we want to test is the functional linear model defined by

$$Y = a + \langle b, X \rangle + U,$$

where $b \in L^2[0, 1]$ and $a \in \mathbb{R}$ are unknown parameters.

• The null hypothesis is

$$H_0: \mathbb{E}(U|X) = 0 \quad \text{a.s.}$$

A > + = + + =

• Let $\widehat{b} \in L^2[0, 1]$ denote a generic estimator of the slope *b* and let

$$\widehat{a} = \overline{Y}_n - \int_0^1 \widehat{b}(t) \overline{X}_n(t) dt = a - \int_0^1 \{\widehat{b}(t) - b(t)\} \overline{X}_n(t) dt + \overline{U}_n,$$

where $\overline{U}_n = n^{-1} \sum_{i=1}^n U_i$. • Let $\widehat{U}_i = Y_i - \widehat{a} - \langle \widehat{b}, X_i \rangle$ be the residuals and let

$$Q_n(\gamma; \widehat{a}, \widehat{b}) = \frac{1}{n(n-1)} \sum_{1 \le i \ne j \le n} \widehat{U}_i \widehat{U}_j \frac{1}{h} K_h(\langle X_i - X_j, \gamma \rangle), \quad \gamma \in \mathcal{S}^p,$$

where $\hat{v}_n^2(\cdot; \hat{a}, \hat{b})$ is an estimate of the variance of $nh^{1/2}Q_n(\cdot; \hat{a}, \hat{b})$.

• Given $B_p \subset S^p$, let

$$\widehat{\gamma}_{n} = \arg \max_{\gamma \in B_{p}} \left[nh^{1/2} Q_{n}(\gamma; \widehat{a}, \widehat{b}) / \widehat{v}_{n}(\gamma; \widehat{a}, \widehat{b}) - \alpha_{n} \mathbb{I}_{\left\{ \gamma \neq \gamma_{0}^{(p)} \right\}} \right]$$

The test statistic is then

$$T_n = nh^{1/2} \frac{Q_n(\widehat{\gamma}_n; \widehat{a}, \widehat{b})}{\widehat{v}_n(\widehat{\gamma}_n; \widehat{a}, \widehat{b})}$$

Suppose

•
$$\|\widehat{b} - b\|_{L^2} = O_{\mathbb{P}}(n^{-
ho})$$
 for some $3/8 <
ho \leq 1/2$

• The bandwidth *h* is such that $n^{1-2\zeta}h^{1/2} \rightarrow 0$ for some $3/8 < \zeta < \rho$.

• Under some stronger moment conditions, we show that an asymptotic α -level test is given by $\mathbb{I}(T_n \ge z_{1-a})$, where z_a is the (1 - a)-quantile of the standard normal distribution.

Consistency

The alternatives of the functional linear model considered are

$$H_{1n}: Y_{in} = a + \langle b, X_i \rangle + r_n \delta(X_i) + U_i^0, \quad n \ge 1, \quad \text{with} \ \mathbb{E}(U_i^0 \mid X_i) = 0,$$

with $\delta(\cdot)$ an real-valued function such that $0 < \mathbb{E}[\delta^4(X)] < \infty$ and $r_n, n \ge 1$ a sequence of real numbers.

• Moreover, $\delta(\cdot)$ satisfies the orthogonality conditions

$$\mathbb{E}[\delta(X)] = 0$$
 and $\mathbb{E}[\delta(X)X] = 0.$

< 回 > < 回 > < 回 >

Assume that

- (i) $r_n^2 n h^{1/2} / \alpha_n \to \infty;$ (ii) $r_n^{-1} \| \widehat{b} - b \|_{L^2} = o_{\mathbb{P}}(1);$ (iii) $\alpha_n / \{ p^{3/2} \ln n \} \to \infty.$
- Then the test based on *T_n* functional linear regression model with probability tending to 1 (under some mild conditions).

Lemma

Let $U, X \in L^2[0, 1]$ be random functions and $Z \in \mathbb{R}^k$ be a random vector. Assume that $\mathbb{E}||U|| < \infty$ and $\mathbb{E}(U) = 0$. (A) The following statements are equivalent:

- $\mathbb{E}(U \mid X, Z) = 0$ a.s.
- $\mathbb{E}\left[\langle U, \mathbb{E}\left(U \mid \langle X, \gamma \rangle, Z\right)\rangle\right] = 0 \text{ a.s. } \forall p \geq 1, \forall \gamma \in S^{p}.$

(B) Under some mild additional conditions, if $\mathbb{P}[\mathbb{E}(U \mid X, Z) = 0] < 1$, then there exists a positive integer p_0 such that for any integer $p \ge p_0$, the set

$$\mathcal{A} = \{ \gamma \in \mathcal{S}^{p} : \mathbb{E}(U \mid \langle X, \gamma \rangle, Z) = 0 \text{ a.s.} \}$$

has Lebesgue measure zero on the unit hypersphere S^p .

The test statistic (1/2)

• For $\gamma \in \mathcal{S}^p$ define

$$Q_n(\gamma) = \frac{1}{n(n-1)h^{k+1}} \sum_{1 \le i \ne j \le n} \langle U_i, U_j \rangle K\left(\langle X_i - X_j, \gamma \rangle / h \right) \widetilde{K}\left((Z_i - Z_j) / h \right),$$

Let

$$\widehat{\nu}_{n}^{2}(\gamma) = \frac{2}{n(n-1)h^{k+1}} \sum_{j \neq i} \langle U_{i}, U_{j} \rangle^{2} \mathcal{K}^{2} \left(\langle X_{i} - X_{j}, \gamma \rangle / h \right) \widetilde{\mathcal{K}}^{2} \left((Z_{i} - Z_{j}) / h \right)$$

• Given $B_{\rho} \subset S^{\rho}$, the least favorable direction γ for H_0 is defined by

$$\widehat{\gamma}_{n} = \arg \max_{\gamma \in \mathcal{B}_{p}} \left[nh^{(k+1)/2} Q_{n}(\gamma) / \widehat{\nu}_{n}(\gamma) - \alpha_{n} \mathbb{I}_{\left\{ \gamma \neq \gamma_{0}^{(p)} \right\}} \right]$$

< 回 ト < 三 ト < 三

The test statistic (2/2)

The test statistic is

$$T_n = nh^{1/2} \frac{Q_n(\widehat{\gamma}_n)}{\widehat{v}_n(\widehat{\gamma}_n)} .$$
(4)

We will show that an asymptotic *α*-level test is given by
 I (*T_n* ≥ *z*_{1-α}), where *z*_{1-α} is the (1 − α)-th quantile of the standard normal distribution.

6 Conclusions

< 回 ト < 三 ト < 三

The simulation design (1/2)

- X is a standard Brownian motion on the unit interval [0, 1].
- Three scenarii for the distribution of *U_i*:
 - Null hypothesis U is $N(0, \sigma^2)$ where $\sigma = 1.219$, U independent of X.
 - Linear alternative

$$U_i = \langle b, X_i \rangle + \varepsilon_i$$

where $b(t) = (\sin(2\pi t^3))^3$, and $\varepsilon_1, \ldots, \varepsilon_n$ are i.i.d. $N(0, \sigma^2)$, where $\sigma = 1.219$, corresponding to a 10% signal-to-noise ratio that is, $E(\langle b, X \rangle^2)/(E(\langle b, X \rangle^2) + \sigma^2) = 0.1$.

• Quadratic alternative

$$U_i = \int_0^1 \int_0^1 h(s,t) X(s) X(t) \, ds \, dt + \varepsilon_i$$

where h(s, t) = 0.6, and $\varepsilon_1, \ldots, \varepsilon_n$ are i.i.d. $N(0, \sigma^2)$, where $\sigma = 1$.

< ロ > < 同 > < 回 > < 回 >

The simulation design (2/2)

We use the Karhunen-Loève expansion of the Brownian motion X

$$X(t) = \sum_{j=1}^{\infty} x_j \frac{1}{(j-0.5)\pi} \sqrt{2} \sin\left((j-0.5)\pi t\right)$$

to build the basis $\mathcal{R} = \{\sqrt{2} \sin((j - 0.5)\pi t) : j = 1, 2, ...\}$

- 1000 samples of $(U_1, X_1), ..., (U_n, X_n)$ of sizes n = 100 and n = 200
- $\alpha_n = 5$, Epanechnikov kernel *K*, several bandwidth values tested
- Critical values corrected by wild bootstrap

Testing the linear model vs. quadratic alternative

Numerical illustrations

Testing the linear model vs. cubic alternative

Numerical illustrations

Testing the quadratic model vs. cubic alternative

The simulated model

$$Y = a + \int_0^1 b(t)X(t) \, dt + \int_0^1 \int_0^1 h(s,t)X(s)X(t) \, ds \, dt + \delta_c(X) + U^0$$

with b(t) = 1 for all $t \in [0, 1]$, and h(s, t) = 0.6 for all $s, t \in [0, 1]$

• The cubic alternative

$$\delta_c(X) = d\left(\int_0^1\int_0^1\int_0^1X(s)X(t)X(z)\,ds\,dt\,dz - \int_0^1X(t)dt\right)$$

where d = 0 under the null and d = 0.9 under the alternative.

Conclusions

Conclusions and possible esxtensions

- A smoothing based goodness-of-fit test with hybrid (functional and finite-dimension) data
 - Test the effect on the covariates on the response
 - Check parametric functional regression (linear, quadratic, quantile,...)
- The asymptotic critical values are standard normal; wild bootstrap is needed for small sample sizes
- It detects nonparametric alternatives
- Mild conditions on the law of the covariates
- The response/errors could be heteroscedastic
- Several extensions are possible
 - dependent observations (once CLT and concentration inequalities for U-processes are available)
 - testing significance of covariates in functional nonparametric regression
